

IN 2009, MA FARMERS CAN REALLY LIGHT IT UP

Is your agricultural land ready to harvest power as allowed by the new Energy Bill?

In July of '08 Governor Patrick signed the *Massachusetts 2008 Energy Bill* into existence. Soon the Department of Public Utilities is expected to finish creating the specific rules to implement many of the law's goals.

One of the most exciting of these is the provision to allow neighbors to band together and share electricity generated from the wind. This 'Neighborhood Net-Metering' regulation will revolutionize the use of open lands, allowing farmers and growers of all types to join with their neighbors in producing home grown, green electricity.

By using 'mid-scale' wind turbines that are large enough to be economical yet not too large to be offensive, our farms, nurseries, cranberry bogs and many other agricultural land owners will now be able to harvest a second crop - electricity - and economically feed it to hundreds of friends and neighbors.

The best part is that your existing operation doesn't have to change at all. Our wind turbines use very little actual land area, allowing you to continue to provide the other much needed local agricultural products your customers are used to.

We at *Aeronautica Windpower* are proud to be a part of this new wave of creating American Energy and reducing our reliance on foreign oil. Our wind turbines are built right here in the Commonwealth, contributing to the local economy with jobs and services. Along with our network of qualified local dealers and installers we can provide all of the required expertise, tools, financing and collateral services required - allow you to spend your time on the farm, doing what you do best. *In short, if you put up the land, we'll put up the turbine.*
